

AGENT OPERATIONS DASHBOARD

How the agent researches, writes, tests, and ships the weekly women-in-AI report

A live view of the autonomous research pipeline — now focused on **women & AI in healthcare R&D**. Every Monday at 09:00 CST it picks a topic, gathers cited statistics, drafts the report, runs an independent QA review, and emails the result to the Medtronic team.

Latest report Week 8 · 2026-06-29 Women & AI in healthcare R&D

12%

of AI researchers are women — and just 16% of AI faculty (UNESCO, 2024)

Key observations the agent surfaced

- Women are a minority at **every layer** of health-AI R&D — research, authorship, funding, leadership, and the engineering bench (lowest, at 12%).
- Female authorship of medical-AI papers stays **under 40%**, and in radiology appears to *fall* the more central AI becomes to the study.
- The gap is **encoded into the product**: chest-X-ray AI underdiagnoses women (Nature Medicine, 2021), trained on trials that were only 34–38% female.
- Capital lags too: all-female teams took ~1–2% of US VC; "women+ health" got 6.6% of 2024 digital-health funding.

35.7%
